```
1.1 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/Chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/Chloroform and Centricon 100. The CDNAs were digested with Sal1 and NotI enzymes and cloned into Sal1/NotI site of pSPORTI plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.2 kb. The library was constructed by Yulan Piao (NIA)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 TGCAAGGCTTCTGGCTACACATTGACCAGTTACAATATGCACTGGGTAAAGCAGACACCT
                                                                                                                                                                                                                                                                                                                                                                  This cDNA sequence encodes the heavy chain variable region VH (AAW85150) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line ATCC 12020. 11D10 was obtained by immunishing naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFG). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG-associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are and diagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polynucleotides, including methods of treating HMFG-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the coding sequence for the murine antibody 11010 heavy chain variable region. This anti-idlotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 111010 is used to prevent the recurrence of HMFG-associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for treating breast tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a

The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for anti-idiotypic antibody for treating HMFG/CEA-associated tumours. The present DMA sequence encodes the heavy chain variable region of the mouse 11D10 anti-idiotype antibody.

The present sequence encodes the murine anti-idiotype monoclonal antibody (MAb) 1A7 variable heavy chain. Wab 1A7 was raised against the anti-ganglioside 2 (GD2) MAb 14G2a, which binds an unique epitope of GD2. As the glycosphingolipid GD2 is expressed at high density by human neuroecodermal tumours, e.g. malignant melanoma, neuroblastoma, glioma, soft tissue sarcoma and small cell carcinoma of the lung, MAb 1A7, or its colms can be used in a vaccine to treat or palliate such diseases. They can also be used to reduce the risk of recurrence of a clinically detectable tumour, and detect an arti-GD2 Ab bound to a tumour cell.

MAb 1A7 overcomes immune tolerance and induces an immune response against GD2, which comprises anti-GD2 Ab (humoral response) and coll-specific cells (cellular response). It can be used to purify anti-GD2, anti-GD2 (Ab1') or 14G2a (Ab1), detect anti-1A7 or anti-GD2 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cDNA, and amplify desired polynucleotides for use in gene therapy.

elicits an anti-GDZ (tumor-associated antigen) immunological response in humans. MAb 1A7 has defined light and heavy chain variable region sequences. The MAD 1A7 and polypeptides can be used for eliciting an anti-GDZ immune response. The polypeptides can also be used for detecting or purifying anti-GDZ antibody. The products can be used for treating GDZ -associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the CDNA encoding the heavy chain variable region of MAD 1A7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a monoclonal antibody (MAb) designated 1A7, which

                                                  The sequence is the variable heavy chain region of monoclonal anti-idiotype antibody 1A7. The polypeptide encoded by this sequence has three CDRs (complementarity determining regions). When administered to an individual the 1A7 antibody induces an immune response against ganglioside GD2. The light chain variable region of the 1A7 antibody hoth the heavy and light chain variable regions of the 1A7 antibody produce anti-GD2 real and antibody responses. The peptides and antibodies may be useful for the modulation of ganglioside GD2, and particularly for the treatment of GD2-associated tumours (e.g. melanoma, neuroblastoma, glioma, soft tissue sarcoma, and small cell carcinoma (including small cell lung cancer).

The invention provides a method of treating of psoriasis by administering an antigen which has similar immunogenic properties to an antigen expressed on cells of psoriatic tissue so that an immunological response is elicited in the individual. The antigen stimulates the generation of anti-idiotype antibodies that neutralize the aberrant immune response causing the psoriasis. The method is used to treat psoriasis, especially chronic plaque, gulttate, pustular, plaque-type psoriasis or psoriatic arthritis. The compositions allow the individual's own immune system to act against psoriatic tissue. The present sequence represents a cDNA encoding the heavy chain variable region of monoclonal antibody 1A7.

The invention relates to humanised monoclonal antibodies (MAb) against Shiga toxins. The humanised MAb that binds to Shiga toxin comprises a constant and a variable region, where: (a) the constant region contains at least part of a human immunoglobulin (Ig) constant region; and (b) the variable region contains at least part of a non-human Ig variable region. Host cells transformed with vectors encoding a humanised MAb against shiga toxin type 2 is useful for treating a patient with an infection caused by enterchemorrhagic Escherichia coli (EHEC) or other Shiga toxin producing bacteria. The humanised MAb can also be used to reduce illness caused by EHEC or other Shiga toxin producing bacteria. EHEC are

associated with food-borne outbreaks of bloody diarrhoea (hemorrhagic colitis) and the hemolytic uremic syndrome. In particular, the humanised MAbs ameliorate edema, thrombocytopenia and uremia associated with EHEC-mediated disease. The present sequence represents a DNA encoding an anti-STX1 heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV-1; human immunodeficiency virus type 1; AIDS; Rev protein; intracellular immunization; gene therapy; single chain antibody; Fv; sFv; antibody engineering; resistance; cell immunity; HeLa; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence given in AAQ81500 encodes an sFv anti-rev antibody consisting of the variable domains of the heavy and light chains of a mouse MAA against HIV-1 IIIB rev. The sFv specifically binds a highly conserved Rev domain. Hela T4 cells expressing the sFv were resistant to all HIV-1 clinical isolates tested. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Method for conducting gene therapy - comprises using recombinant gene encoding antibody binding antigen associated with a disease; useful for providing cell immunity.
                                                                                                                                366

The present sequence encodes a single chain sFV anti-rev antibody
constructed using variable domains of the heavy and light chains of a
murine monoclonal antibody against (HIV-IIIIB) rev (the parent
antibody). This is incorporated into a viral vector where
expression of the anti-rev gene causes inhibition of the rev function
and so affects replication of the other viral (HIV). Rev is one of the
essential requiatory proteins of HIV, it binds to rev responsive element
(RRE) and promotes the nuclear export, stabilisation and utilisation of
the viral mRNA's containing RRE. A novel gene therapy method has been
produced, where a recombinant (rec) gene is introduced into the cells of
a mammal. The method is improved by using a rec gene encoding an
antigen associated with a disease. The method is used to prevent or
antigen associated with a disease. The method is used to prevent or
halt the progress of a disease by IC immunisation. Specifically, the Ab
can be used to inhibit the replication of a virus, such as human T-cell
can be used to inhibit the replication of a virus, such as human T-cell
benkamia virus or especially HIV-i. or of other pathogens, e.g.
development of the disease and can be used to control the severity of
                                                                                                                                                   Improved gene therapy using recombinant gene coding for an antibody - for intracellular immunisation against pathogens recognised by the antibody, esp. human immunodeficiency virus HIV-1

The present sequence encodes a fusion of an anti-CD20.single chain antibody and streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs to expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence are intended in a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular,

The present sequence encodes a fusion of an anti-CD20 single chain antibody and streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer.

Cells, particularly tumour cells associated with cancer.
                                                                                                                                                                                                                                                 these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, target site within a mammallan host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Reno JM;

The present sequence encodes a fusion of an anti-CD20 single chain antibody (B9E9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a clound site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour
is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding a fusion of anti-CD20 single chain antibody/streptavidin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reno JM;

e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a
nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells particularly tumour cells associated with cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes a fusion of an anti-CD20 single chain antibody (1989) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second
                   e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reno JM;

cc receptor. The specification describes CD-20 specific redirected T cells which express and bear on the cell surface membrane a CD20-chimeric receptor comprising an intracellular signalling domain, a transmembrane domain and an extracellular domain, the extracellular domain comprising a CD20-specific receptor. The genetically engineered CD20-specific credirected T cells are useful for treating a CD20+ malignancy, such as non-Hodgkin's lymphoma or CD20+ acute or chronic leukemia, in a chaman patient having previously undergone myeoablative chemotherapy and stem cell rescue. The genetically engineered CD20-specific redirected crem cell rescue. The genetically engineered CD20-specific redirected crem cell rescue. The genetically engineered CD20-specific redirected cas autoimmune disease (lupus or rheumatoid arthritis) in a patient.
